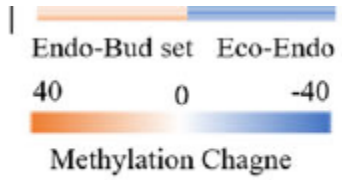
Modification requirements：

1. Page 4: “Figure 2A” should be changed to “Figure 3A”.

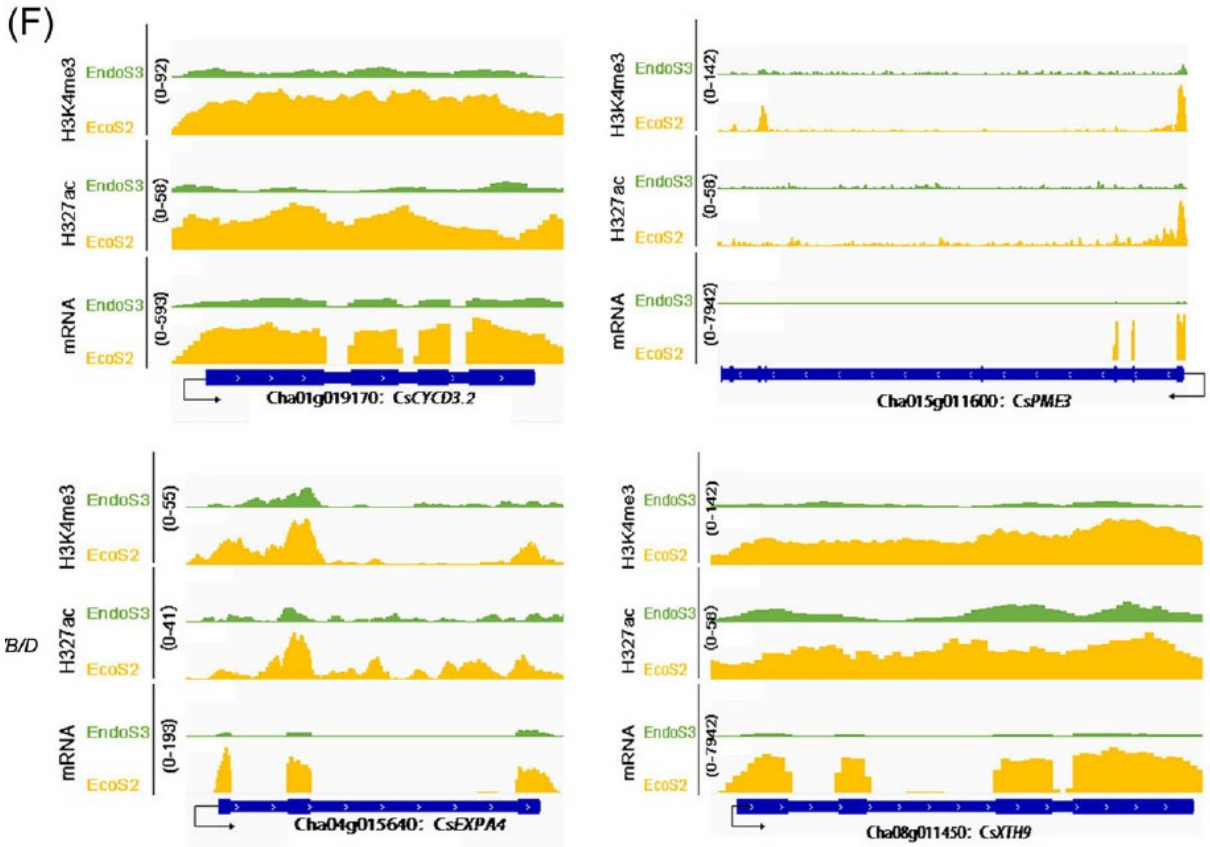
terns may be reprogrammed during dormancy release in tea plants (Figure 2A). To validate this hypothesis,

2. Page 6: Figure 3 should be replaced. Due to a misspelling of the word "change". The correct figure has been provided in the attachment.

Change-change bar ann—not correct



3. Page 9: in Figure 5F, “H327ac” should be “H3K27ac”. The correct figure has been provided in the attachment. Please replaced the figure.



4. Page 10: “Figure 6B” should be “Figure 6B, C”.

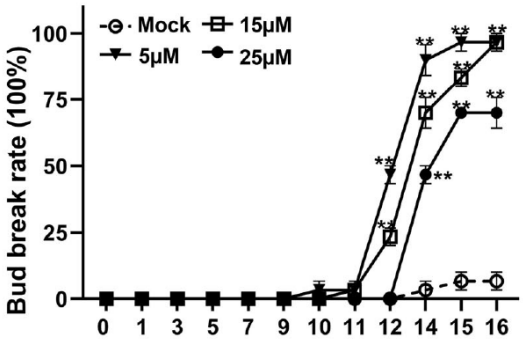
DEGs overlapped with genes marked by both activating histone modifications, suggesting coordinated epigenetic regulation (Figure 6B). To identify the biological processes

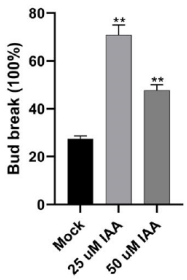
5. Page 10: “Figure 7D” should be “Figure 7E”.

(*CsYUC8* and *CsARF18*) in a network with key transcription factors, including ethylene-responsive factors (*ERF041a/b*), *TCX2/3*, *ERN1*, *TSO1*, and *WIN* (Figure 7D), suggesting hierarchical control of IAA signaling. To validate the role of IAA in bud dormancy release, exogenous IAA (25 and 50 μM) was

6. Page 14: The x-axis of Figure 8B should be labeled with the unit "days", and “100%” should be “%”. The correct figure has been provided in the attachment.

(B)



7. Page 12: Figure 7F “100%” should be “%”. The correct figure has been provided in the attachment.


(F)
